# 1 Introduction

The list implementation in L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  serves a dual purpose: it implements real lists such as `itemize` or `enumerate`, but it is also used as the basis for vertical blocks, i.e., to specify the vertical spacing and paragraph handling after such block, e.g., in environments like `center`, `quote`, `verbatim`, or in the theorem environments. They are all implemented as “trivial” lists with a single (hidden) item.

While this was convenient to get a consistent layout using a single implementation it is not adequate if it comes to interpreting the structure of a document, because environments based on `trivlist` should not advertise themselves as being a “list” — after all, from a semantic point of view they aren’t lists.

The approach taking here is therefore to offer separate object types: `block` (horizontally or vertically oriented data that needs some handling at the start and the end), `para` (that deals with different paragraph layouts), `list` (that handles list related parameters, and `item` (for item layouts and handling), to address the independent aspects and also offer the object type `blockenv` that ties them together as necessary.

For example, a `quote` environment would make use of a (display) `block` and some `para` handling while an standard `enumerate` would make use of a display `block`, a `list`, and an `item` and `para` instance. An inline list (like `enumerate*` from the `enumitem` package) would be using the same `list` instance but a different (horizontally oriented) `block`.

## 2 Object types and templates for blocks and lists

### 2.1 Object types

#### 2.1.1 The object type ‘block’

**Arg:** 1 key/value list to alter the default block parameters

##### Semantics:

Handle the layout aspects of a block of data. In case of a “display” block (i.e., vertically oriented) the spacing and page breaking as well as the handling if the block starts a paragraph or ends one, that is, if text is immediately following the block without being separated by an empty line, then this text is considered to be in the same paragraph as the block.

In case of a horizontally oriented block it covers any special handling at the start and end of the block, e.g, extra spacing, prohibiting or encouraging line breaks, and so forth.

#### 2.1.2 The object type ‘para’

**Arg:** 1 key/value list to alter the default item parameters

##### Semantics:

Sets up paragraph-specific parameters for H&J, e.g., to implement justification variations, the behavior of \\ etc. The instances are used in higher-level templates, e.g., in a `block`.

### **2.1.3 The object type ‘list’**

**Arg:** 1 key/value list to alter the default item parameters

#### **Semantics:**

Handle the aspects related to list design, e.g., the use and formatting of counters, etc.

Note that this does not cover block-related aspects, i.e., a list instance could be used both for a display list or for an inline line.

### **2.1.4 The object type ‘item’**

**Arg:** 1 key/value list to alter the default item parameters

#### **Semantics:**

A sub-type used as part of *list* to easily cover alternative layout for list items.

### **2.1.5 The object type ‘blockenv’**

**Arg:** 1 key/value list to alter the default item parameters

#### **Semantics:**

This object type is used to implement document-level environments. It defines a *block* instance to handle the layout at the “edge” of the environment data, possibly some paragraph setup through a *para* instance, potentially an “inner” instance for more complicated environments (such as lists), and possibly some additional setup code for certain environments.

It also defines how the *blockenv* behaves with respect to nesting, e.g., does it change when nested and if so how many levels of nesting are supported, etc.

Finally, the object type defines how it appears in a tagged PDF document, what tag names are used, how they are rolemapped and whether it adds additional attributes, etc.

## **2.2 Templates**

### **2.2.1 The blockenv template ‘display’**

#### **Attributes:**

**env-name** (*tokenlist*) Name of the environment used only in tracing

**tag-name** (*tokenlist*) Name of the tag in the PDF. If not explicitly given the name is defined by the **tagging-recipe**

**tag-class** (*tokenlist*) An explicit tag class attribute

**tagging-recipe** (*tokenlist*) Defines the way tagging is done. Currently the values **basic**, **standard**, and **list** are supported Default: **standard**

<b>level-increase</b> ( <i>boolean</i> )	Does this <i>blockenv</i> increase the block level if it is nested in an outer block?	Default: <code>true</code>
<b>setup-code</b> ( <i>tokenlist</i> )	Initial setup code. This is executed after legacy defaults (from <code>\@listi</code> , <code>\@listii</code> , etc.) are used but before the block instance is called	
<b>block-instance</b> ( <i>tokenlist</i> )	Part of the name of the <i>block</i> instance that is called. The full name has a <code>-&lt;level&gt;</code> appended	Default: <code>displayblock</code>
<b>para-instance</b> ( <i>tokenlist</i> )		
<b>inner-level-counter</b> ( <i>tokenlist</i> )	Name of an existing (!) counter that is incremented and used to determine final name of the <b>inner-instance</b> or empty if always the same inner instance should be used	
<b>max-inner-levels</b> ( <i>tokenlist</i> )	Maximum number of nested environments of this kind. Only relevant if there is a <b>inner-level-counter</b> specified	Default: 4
<b>inner-instance-type</b> ( <i>tokenlist</i> )	Object type of the inner instance	Default: <code>list</code>
<b>inner-instance</b> ( <i>tokenlist</i> )	Name of the inner instance (if any).	
<b>para-flattened</b> ( <i>boolean</i> )	<code>describe</code>	Default: <code>false</code>
<b>final-code</b> ( <i>tokenlist</i> )	Final setup code	Default: <code>\ignorespaces</code>

**Semantics & Comments:** This *blockenv* template supports the legacy list setting that are found in many document classes in the macros `\@listi`, `\@listii`, up to `\@listvi`. It also uses the counter `\@listdepth` to track nesting of block, again mainly to support legacy setups (internally it gives it a more appropriate name but it remains accessible through the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  name).

It first checks that nothing is too deeply nested. If the level should increase then the increments the `\@listdepth` counter and calls the corresponding `\@list...` macro to update the legacy defaults. If **level-increase** is set to false this is bypassed.

It then sets up the tagging via the **tagging-recipe** setting and executes any code in **setup-code**.

Afterwards it calls the appropriate *block* instance based on **block-instance** and current level, e.g., `displayblock-1`. Then it sets up paragraph parameters if a **para-instance** was specified (otherwise they stay as they are).

If a **inner-instance** was specified this is called next, or more precisely: if no **inner-level-counter** was specified the instance **inner-instance** is called.

Otherwise, the **inner-level-counter** is incremented and the instance with the name **inner-instance-*inner-level-counter*** is called.

Finally, the **final-code** is executed (by default `\ignorespaces`).

The maximum number of *blockenvs* that can be nested into each other is is restricted by the L<sup>A</sup>T<sub>E</sub>X counter **maxblocklevels** with a default value of 6. If this value is increased then it is necessary to provide additional instances, e.g., `displayblock-7`, etc. Decreasing is, of course, always possible, then some of the instances defined are not used and instead the user gets an error that there is too much nesting going on.

If the key **level-increase** is set to `false` then such an environment doesn't alter the nesting level and therefore you can nest those environments as often as you like (a typical example would be `flushleft` anywhere in the nesting hierarchy, that would have no effect on hitting the boundary).

### 2.2.2 The block template ‘display’

Attributes:

<code>heading</code> ( <i>tokenlist</i> )	<i>not really used yet</i>
<code>beginsep</code> ( <i>skip</i> )	Default: \topsep
<code>begin-par-skip</code> ( <i>skip</i> )	Default: \partopsep
<code>par-skip</code> ( <i>skip</i> )	Default: \parsep
<code>end-skip</code> ( <i>skip</i> )	Default: value from <code>beginsep</code>
<code>end-par-skip</code> ( <i>skip</i> )	Default: value from <code>begin-par-skip</code>
<code>beginpenalty</code> ( <i>integer</i> )	Default: \@beginparpenalty
<code>endpenalty</code> ( <i>integer</i> )	Default: \@endparpenalty
<code>leftmargin</code> ( <i>length</i> )	Default: \leftmargin
<code>rightmargin</code> ( <i>length</i> )	Default: \rightmargin
<code>parindent</code> ( <i>length</i> )	Default: \listparindent

**Semantics & Comments:** The idea of a `heading` key needs some further thoughts. Maybe instead the object type should accept a second argument and receive input for such a heading from the document level instead.

The names of the keys need further thoughts and some decision. Right now it is a mixture of those with hyphens and those that match legacy register names (the way `enumitem` did its keys).

Also `parindent` conflicts with `indent-width`!

### 2.2.3 The para template ‘std’

Attributes:

<code>indent-width</code> ( <i>length</i> )	Default: \parindent
<code>start-skip</code> ( <i>skip</i> )	Default: 0pt
<code>left-skip</code> ( <i>skip</i> )	Default: 0pt
<code>right-skip</code> ( <i>skip</i> )	Default: 0pt
<code>end-skip</code> ( <i>skip</i> )	Default: \flushglue
<code>fixed-word-spaces</code> ( <i>boolean</i> )	Default: false
<code>final-hyphen-demerits</code> ( <i>integer</i> )	Default: 5000
<code>cr-cmd</code> ( <i>tokenlist</i> )	Default: \normalcr
<code>para-class</code> ( <i>tokenlist</i> )	Default: justify

#### 2.2.4 The list template ‘std’

##### Attributes:

**counter** (*tokenlist*) Counter name to be used in a numbered list or empty, if the list is unnumbered

**item-label** (*tokenlist*) Label “string” for a fixed label or as generated from the current counter value

**start** (*integer*) Start value for the counter if the list is numbered, otherwise irrelevant  
Default: 1

**resume** (*boolean*) Should a numbered list be resumed from the last instance?  
Default: false

**item-instance** (*instance*) Instance of type **item** to be used to format the label string  
Default: basic

May need to be on a different template level **item-skip** (*skip*) The space in front of an item in the list.  
Default: \itemsep

**item-indent** (*length*) Horizontal displacement of the item.  
Default: Opt

**item-penalty** (*integer*) Penalty for breaking before an item (except the first)  
Default: \itempenalty

**label-width** (*length*) Width reserved for the formatted item label  
Default: \labelwidth

**label-sep** (*length*) Horizontal separation between label and following text  
Default: \labelsep

**legacy-support** (*boolean*) Is formatting the label via \makelabel supported?  
Default: false

#### 2.2.5 The item template ‘std’

##### Attributes:

**counter-label** (*function1*) unused  
Default: \arabic{#1}

**counter-ref** (*function1*) unused  
Default: value from counter-label

**label-ref** (*function1*) unused  
Default: #1

**label-autoref** (*function1*) unused  
Default: item #1

**label-format** (*function1*) Formatting of the label, questionable the way it is used  
Default: #1

<code>label-strut</code> ( <i>boolean</i> )	Add a \strut to the label?	Default: <code>false</code>
<code>label-align</code> ( <i>choice</i> )	Supported values <code>left</code> , <code>center</code> , <code>right</code> , and <code>parleft</code> . <i>Only partly implemented</i>	Default: <code>right</code>
<code>label-boxed</code> ( <i>boolean</i> )	Should the label be boxed?	Default: <code>true</code>
<code>next-line</code> ( <i>boolean</i> )		Default: <code>false</code>
<code>text-font</code> ( <i>tokenlist</i> )	<i>unused</i>	
<code>compatibility</code> ( <i>boolean</i> )		Default: <code>true</code>

**Semantics & Comments:** This template is only rudimentary implemented at the moment. It probably needs other keys and the existing ones need a proper implementation.

## 3 Tagging support

### 3.1 Paragraph tags

Paragraphs in L<sup>A</sup>T<sub>E</sub>X can be nested, e.g., you can have a paragraph containing a display quote, which in turn consists of more than one (sub)paragraph, followed by some more text which all belongs to the same outer paragraph.

In the PDF model and in the HTML model that is not supported — a limitation that conflicts with real live, given that such constructs are quite normal in spoken and written language.

The approach we take to resolve this is to model such “big” paragraphs with a structure named `<text-unit>` and use `<text>` (rollmapped to `<P>`) only for (portions of) the actual paragraph text in a way that the `<text>`s are not nested. As a result we have for a simple paragraph the structures

```
<text-unit>
  <text>
    The paragraph text ...
  </text>
</text-unit>
```

The `<text-unit>` structure is rollmapped to `<Part>` or possibly to `<Div>` so we get a valid PDF, but processors who care can identify the complete paragraphs by looking for `<text-unit>` tags.

In the case of an element, such as a display quote or a display list inside the paragraph, we then have

```
<text-unit>
  <text>
    The paragraph text before the display element ...
  </text>
  <display element structure>
    Content of the display structure possibly involving inner <text-unit> tags
  </display element structure>
  <text>
```

```

    ... continuing the outer paragraph text
  </text>
</text-unit>
```

In other words such a display block is always embedded in a `<text-unit>` structure, possibly preceded by a `<text>...</text>` block and possibly followed by one, though both such blocks are optional.

Thus an `itemize` environment that has some introductory text but no text immediately following the list would be tagged as follows:

```

<text-unit>
  <text>
    The intro text for the itemize environment ...
  </text>
  <itemize>
    <LI>
      <Lbl> label </Lbl>
      <LBody>
        The text of the first item involving <text-unit> as necessary ...
      </LBody>
    </LI>
    <LI>
      The second item ...
    </LI>
    ... further items ...
  </itemize>
</text-unit>
```

The `<itemize>` is rollmapped to `<L>`.

For some display blocks, such as centered text, we use a simpler strategy. Such blocks still ensure that they are inside a `<text-unit>` structure but their body uses simple `<text>` blocks and not `<text-unit><text>` inside, e.g., the input

```

This is a paragraph with some
\begin{center}
  centered lines

  with a paragraph break between them
\end{center}
followed by some more text.
```

will be tagged as follows:

```

<text-unit>
  <text>
    This is a paragraph with some
  </text>
  <text /0 /Layout /TextAlign/Center>
    centered lines
  </text>
  <text /0 /Layout /TextAlign/Center>
    with a paragraph break between them
```

```

</text>
<text>
    followed by some more text.
</text-unit>
```

### 3.2 Tagging recipes

There are a number of different tagging recipes that implement different tagging approaches. They are selected through the `tagging-recipe` of the `blockenv` template. Currently the following values are implemented:

**basic** This recipe does the following:

- Ensure that the `blockenv` is inside a `<text-unit>` structure, if necessary, start one.
- If inside a `<text-unit><text>`, then close the `</text>` but leave the `<text-unit>` open.
- Text inside the body of the environment starts with `<text-unit><text>` if `para-flattened` is set to `false`, otherwise just with `<text>`.
- At the end of the environment close `</text>` and possibly an inner `<text-unit>` if open.
- Then look if the environment is followed by an empty line (`\par`). If so, close the outer `<text-unit>` and start any following text with `<text-unit><text>`. Otherwise, don't and following text restarts with a just a `<text>` (and no paragraph indentation)

**standard** This recipe is like the `basic` one as far as handling `<text-unit>` and `<text>` is concerned. In addition

- it starts an inner tagging structure (i.e., which is therefore a child of the outer `<text-unit>`).
- By default this structure is a `<Figure>` unless overwritten by the key `tag-name`. If that key is used, a suitable rollmap needs to be provided for the name given.
- At the end of the environment that inner structure is closed again so that we are back on the `<text-unit>` level from the outside.
- Then the lookahead for an empty line is done as described previously.

**list** This recipe is like the `standard` one except that

- the inner structure is a list (`<L>`).
- Furthermore everything is set up so that we have list items (`<LI>`) with suitable substructures (`<Lb1>` for the item labels and `<LBody>` for the item bodies).
- If the key `tag-name` is specified, this is used as the tag name for the whole list instead of `<L>`. Of course, it should then have a suitable rollmap.
- If the key `tag-class` is specified then this is used as the class attribute. Again, this requires a suitable setup on the outside.
- At the end of the environment the `</LBody>`, `</LI>`, and `</L>` (or the tag name used) are closed.
- Then the lookahead for an empty line is done as described previously.

## 4 The Implementation

```
1 <*package>
2 <@=block>
3 \ProvidesPackage {latex-lab-testphase-block-tagging}
4 [\\ltblocksdate\\space \\ltblocksversion\\space
5 blockenv implementation]
6 We make use of templates:
7 \RequirePackage{xtemplate}
8 Generell kernel changes, also loaded by the sec and toc code.
9 \RequirePackage{latex-lab-kernel-changes}
10 \ExplSyntaxOn
11 \tl_new:N \\l__block_item_align_tl
12 \tl_new:N\\l__block_legacy_env_params_tl
```

UFi:this variable(s) must  
be declared:

### 4.1 Handling \par after the end of the list

An empty line (or a `\par`) after a list has semantic meaning as it defines whether the following text is logically within the same paragraph as the list (no empty line) or whether it starts a new paragraph and the paragraph containing the list ends at the end of the list (empty line after the list). This is handled by L<sup>A</sup>T<sub>E</sub>X using a legacy flag called `@endpe` and set of commands inside the generic `\end` (calling `\@doendpe`) and as part of the list environments identifying themselves as “paragraph ending environments” (by setting this flag).

For the reimplementations of the list environments including support of tagging we need to augment that mechanism slightly and add some kernel hook(s) to add the tagging code if needed.

`\@doendpe` The original L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> command is augmented to allow for tagging.

```
11 \def\@doendpe{\@endpefalse
12   \def\par
13   {
14     \restorepar
15     \clubpenalty\clubpenalty
```

At this point we add the tagging code that closes an open `<text-unit>`, `<text>` tag combination, if necessary:

```
16   \__kernel_displayblock_doendpe:
```

The standard `\par` command (`\par_end:`) acts on `@endpe` and attempts to close a still open `text-unit` and this would be wrong if it was already closed above. So we have to reset the switch to false first.

```
17   \@endpefalse
18   \everypar{}
19   \par
20 }
21 \everypar{\setbox\z@\lastbox}
22   \everypar{}
23   \endpefalse
24 }
25 }
```

By default we don't do any tagging:

```
26 \cs_new_eq:NN \__kernel_displayblock_doendpe: \prg_do_nothing:
```

verify that this claim is  
actually correct!

The flag itself should be set globally not locally.

```
27 \def\@endpetrue {\global\let\if@endpe\iftrue}
28 \def\@endpefalse{\global\let\if@endpe\iffalse}
```

(End definition for `\@doendpe`. This function is documented on page ??.)

## 4.2 Object and template interfaces

`blockenv (objecttype)` All object types expect a single key–value argument used to tweak template parameters  
`block (objecttype)` specific to a given use in the document. This section is devoted to template interfaces,  
`para (objecttype)` and the template code is covered later.

```
29 \DeclareObjectType{blockenv}{1}
30 \DeclareObjectType{block}{1}
31 \DeclareObjectType{para}{1}
32 \DeclareObjectType{list}{1}
33 \DeclareObjectType{item}{1}
```

`blockenv display (templ.)`

```
34 \DeclareTemplateInterface{blockenv}{display}{1}
35 {
36   env-name      : tokenlist ,
37   tag-name      : tokenlist ,
38   tag-class     : tokenlist ,
39   tagging-recipe : tokenlist = standard,
40   level-increase : boolean = true ,
41   setup-code    : tokenlist ,
42   block-instance : tokenlist = displayblock ,
43   para-instance  : tokenlist ,
44   inner-level-counter : tokenlist,
45   max-inner-levels   : tokenlist = 4,
46   inner-instance-type : tokenlist = list ,
47   inner-instance    : tokenlist ,
48   para-flattened  : boolean = false ,
49   final-code     : tokenlist = \ignorespaces ,
50 }
```

`block display (templ.)`

```
51 \DeclareTemplateInterface{block}{display}{1}
52 {
53   heading      : tokenlist = ,                                %??
54   beginsep     : skip = \topsep ,
55   begin-par-skip : skip = \partopsep ,
56   par-skip     : skip = \parsep ,
57   end-skip     : skip = \KeyValue{beginsep} ,                % conflict with name below
58   end-par-skip : skip = \KeyValue{begin-par-skip} ,
59   beginpenalty  : integer = \UserName{@beginparpenalty} ,
60   endpenalty    : integer = \UserName{@endparpenalty} ,
61   leftmargin    : length = \leftmargin ,
62   rightmargin   : length = \rightmargin ,
63   parindent     : length = \listparindent ,
64   % font        : tokenlist      % maybe add? (or more general for fonts and color)
```

```

65 }

para std (templ.)
66 \DeclareTemplateInterface{para}{std}{1}
67 {
68   indent-width      : length = \parindent ,
69   start-skip        : skip = Opt ,
70   left-skip         : skip = Opt ,
71   right-skip        : skip = Opt ,
72   end-skip          : skip = \flushglue ,
73   fixed-word-spaces : boolean = false ,
74   final-hyphen-demerits : integer = 5000 ,
75   cr-cmd            : tokenlist = \normalcr ,
76   para-class         : tokenlist = justify ,
77 }

list std (templ.)
78 \DeclareTemplateInterface{list}{std}{1}      % optional
79 {
80   counter          : tokenlist = ,
81   item-label        : tokenlist = ,
82   start             : integer = 1 ,
83   resume            : boolean = false ,
84   item-instance     : instance{item} = basic ,
85   item-skip         : skip = \itemsep ,
86   item-penalty      : integer = \UseName{@itempenalty} ,
87   item-indent       : length = Opt ,           % was \itemindent
88   label-width       : length = \labelwidth ,
89   label-sep         : length = \labelsep ,
90   legacy-support    : boolean = false ,
91 }

item std (templ.)
92 \DeclareTemplateInterface{item}{std}{1}
93 {
94   counter-label : function{1} = \arabic{#1} ,
95   counter-ref   : function{1} = \KeyValue{counter-label} ,
96   label-ref     : function{1} = #1 ,
97   label-autoref : function{1} = item-#1 ,
98   label-format  : function{1} = #1 ,
99   label-strut   : boolean = false ,
100  label-align   : choice {left,center,right,parleft} = right ,
101  label-boxed   : boolean = true ,

103  text-font     : tokenlist ,
104  compatibility  : boolean = true ,
105 }

```

### 4.3 Useful helper commands

This section collects `\exp3` commands that will be useful.

\\_\\_block\\_skip\\_set\\_to\\_last:N Set a skip register to the value of an immediately preceding skip or zero if there was none  
\\_\\_block\\_skip\\_remove\\_last:

```
106 \cs_new_protected:Npn \_\_block_skip_set_to_last:N #1 {  
107     \skip_set:Nn #1 { \tex_lastskip:D }  
108 }
```

Remove a skip previous skip if it is directly in front (not allowed in unrestricted vertical mode).

```
109 \cs_new_eq:NN \_\_block_skip_remove_last: \tex_unskip:D
```

(End definition for \\_\\_block\\_skip\\_set\\_to\\_last:N and \\_\\_block\\_skip\\_remove\\_last:.)

\tl\_if\_novalue:nTF

```
110 \cs_generate_variant:Nn \tl_if_novalue:nTF { o }
```

(End definition for \tl\_if\_novalue:nTF. This function is documented on page ??.)

\tag\_if\_active:T If tagging support is not loaded then we shouldn't try to execute any tagging related commands. Eventually this can go once the basic support is available in the kernel.  
can vanish one day

```
111 \cs_if_exist:NF \tag_if_active:T  
112     { \cs_new_eq:NN \tag_if_active:T \use_none:n }
```

(End definition for \tag\_if\_active:T. This function is documented on page ??.)

#### 4.3.1 Debugging

\g\\_block\_debug\_bool

```
113 \bool_new:N \g\_block_debug_bool
```

(End definition for \g\\_block\_debug\_bool.)

\\_\\_block\_debug:n

```
114 \cs_new_eq:NN \_\_block_debug:n \use_none:n
```

```
115 \cs_new_eq:NN \_\_block_debug_typeout:n \use_none:n
```

(End definition for \\_\\_block\_debug:n and \\_\\_block\_debug\_typeout:n.)

\block\_debug\_on:

\block\_debug\_off:

\\_\\_block\_debug\_gset:

```
116 \cs_new_protected:Npn \block_debug_on:  
117     {  
118         \bool_gset_true:N \g\_block_debug_bool  
119         \_\_block_debug_gset:  
120     }
```

```
121 \cs_new_protected:Npn \block_debug_off:  
122     {
```

```
123         \bool_gset_false:N \g\_block_debug_bool  
124         \_\_block_debug_gset:  
125     }
```

```
126 \cs_new_protected:Npn \_\_block_debug_gset:  
127     {
```

```
128     \cs_gset_protected:Npx \_\_block_debug:n ##1  
129     { \bool_if:NT \g\_block_debug_bool {##1} }  
130     \cs_gset_protected:Npx \_\_block_debug_typeout:n ##1  
131     { \bool_if:NT \g\_block_debug_bool { \typeout{==>~ ##1} } }
```

(End definition for \block\_debug\_on:, \block\_debug\_off:, and \\_\_block\_debug\_gset:. These functions are documented on page ??.)

```
\DebugBlocksOn
\DebugBlocksOff
133 \cs_new_protected:Npn \DebugBlocksOn { \block_debug_on: }
134 \cs_new_protected:Npn \DebugBlocksOff { \block_debug_off: }
135 \DebugBlocksOff

(End definition for \DebugBlocksOn and \DebugBlocksOff. These functions are documented on page ??.)
```

## 4.4 Implementation of the document-level block environments

Most such environments are pretty simple: they take an option argument and call a `blockenv` instance to do the work. At the end of environment we call `\endblockenv` to finish.

### 4.4.1 Displayblock environments

There are two basic block environment which are similar to L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> 's `trivlist` except that there aren't degenerated lists and thus have no hidden `\item` inside.

```
displayblock (env.)
136 \NewDocumentEnvironment{displayblock}{!O{}}
137   { \UseInstance{blockenv}{displayblock} {#1} }
138   { \endblockenv }

displayblockflattened (env.)
139 \NewDocumentEnvironment{displayblockflattened}{!O{}}
140   { \UseInstance{blockenv}{displayblockflattened} {#1} }
141   { \endblockenv }

center (env.)
flushleft (env.)
142 \AddToHook{begindocument/before}{%
flushright (env.)
143   \RenewDocumentEnvironment{center}{!O{}}
144   { \UseInstance{blockenv}{center}{#1} }
145   { \endblockenv }

146   \RenewDocumentEnvironment{flushright}{!O{}}
147   { \UseInstance{blockenv}{flushright}{#1} }
148   { \endblockenv }

149   \RenewDocumentEnvironment{flushleft}{!O{}}
150   { \UseInstance{blockenv}{flushleft}{#1} }
151   { \endblockenv }
152 }
```

#### 4.4.2 Display quote environments

```

quote (env.)
quotation (env.) 153 \AddToHook{begindocument/before}{%
 154   \RenewDocumentEnvironment{quote}{!O{}{}}{%
 155     { \UseInstance{blockenv}{quote} {#1} }{%
 156     { \endblockenv }{%
 157       \RenewDocumentEnvironment{quotation}{!O{}{}}{%
 158         { \UseInstance{blockenv}{quotation} {#1} }{%
 159         { \endblockenv }{%
 160       }{%
 161     }{%
 162   }{%
 163   \RenewDocumentEnvironment{verbatim}{!O{}{}}{%
 164     { \UseInstance{blockenv}{verbatim} {#1} }{%
 165     { \xverbatim }{%
 166     }{ \endblockenv }{%
 167     \RenewDocumentEnvironment{verbatim*}{!O{}{}}{%
 168       { \UseInstance{blockenv}{verbatim} {#1} }{%
 169       { \setupverbvisible\space\frenchspacing\@vobeyspaces }{%
 170       { \sxverbatim }{%
 171       }{ \endblockenv }{%
 172     }{%
 173   }{%
 174 }{%
 175 \def\legacyverbatimsetup{%
 176   \language\l@nohyphenation
 177   \tempswafalse
 178   \def\par{%
 179     \if@tempswa
 180       \leavevmode \null \@@par\penalty\interlinepenalty
 181     \else
 182       \tempswatrue
 183       \ifhmode\@@par\penalty\interlinepenalty\fi
 184     \fi}%
 185   \let\do\makeother \dospecials
 186   \obeylines \verbatim@font \noligs
 187   \everypar \expandafter{\the\everypar \unpenalty}%
 188   \tl_set:Nn \l__tag_para_main_tag_tl {codeline}
 189   \tagtool{paratag=Code}%
 190   \setupverbinvisible\space\frenchspacing\@vobeyspaces
 191 }{%
 192 }{%
 193 \def\block{%
 194 }
```

#### 4.4.3 Verbatim environments

```

verbatim (env.)
verbatim* (env.) 161 \AddToHook{begindocument/before}{%
 162   \RenewDocumentEnvironment{verbatim}{!O{}{}}{%
 163     { \UseInstance{blockenv}{verbatim} {#1} }{%
 164     { \xverbatim }{%
 165     }{ \endblockenv }{%
 166     \RenewDocumentEnvironment{verbatim*}{!O{}{}}{%
 167       { \UseInstance{blockenv}{verbatim} {#1} }{%
 168       { \setupverbvisible\space\frenchspacing\@vobeyspaces }{%
 169       { \sxverbatim }{%
 170       }{ \endblockenv }{%
 171     }{%
 172   }{%
 173 }
```

#### Helper commands for verbatim

```

\legacyverbatimsetup
 174 <@@=>
 175 \def\legacyverbatimsetup{%
 176   \language\l@nohyphenation
 177   \tempswafalse
 178   \def\par{%
 179     \if@tempswa
 180       \leavevmode \null \@@par\penalty\interlinepenalty
 181     \else
 182       \tempswatrue
 183       \ifhmode\@@par\penalty\interlinepenalty\fi
 184     \fi}%
 185   \let\do\makeother \dospecials
 186   \obeylines \verbatim@font \noligs
 187   \everypar \expandafter{\the\everypar \unpenalty}%
 188   \tl_set:Nn \l__tag_para_main_tag_tl {codeline}
 189   \tagtool{paratag=Code}%
 190   \setupverbinvisible\space\frenchspacing\@vobeyspaces
 191 }{%
 192 }{%
 193 <@@=block>
```

(End definition for `\legacyverbatimsetup`. This function is documented on page ??.)

`\@setupverbinspace` In the pdfTeX engine we need to use `\pdffakespace` chars for the invisible spaces.

```
194 \newcommand{\@setupverbinspace}{}
195 \tag_if_active:T {
196   \bool_if:NF\g__tag_mode_lua_bool
197   {
198     \renewcommand{\@setupverbinspace}{\def\xobeysp{\nobreakspace\pdffakespace}}
199   }
200 }
```

(End definition for `\@setupverbinspace`. This function is documented on page ??.)

#### 4.4.4 Standard list environments

`itemize (env.)` For the standard lists everything is managed by the `blockenv` instance.

```
201 \AddToHook{begindocument/before}{
202   \RenewDocumentEnvironment{itemize}{!0{}}
203   { \UseInstance{blockenv}{itemize} {#1} }
204   { \endblockenv }
205 
206   \RenewDocumentEnvironment{enumerate}{!0{}}
207   { \UseInstance{blockenv}{enumerate} {#1} }
208   { \endblockenv }
209 
210   \RenewDocumentEnvironment{description}{!0{}}
211   { \UseInstance{blockenv}{description} {#1} }
212   { \endblockenv }
```

`list (env.)` The legacy 2e list environment is more complicated as we have to get the extra arguments accounted for.

```
212 \AddToHook{begindocument/before}{
213   \RenewDocumentEnvironment{list}{!0{} m m}
214   {
```

We do this by storing them away and then call the `list` instance. Inside this instance the `setup-code` key contains `\legacylistsetupcode`, which makes use of the stored values.

```
215   \tl_set:Nn \@itemlabel {#2}
216   \tl_set:Nn \l__block_legacy_env_params_tl {#3}
217   \UseInstance{blockenv}{list} {#1}
218 }
219 { \endblockenv }
220 }
```

Again something that should probably elsewhere: the `rolemapping`.

```
221 \tag_if_active:T {
222   \tagpdfsetup{add-new-tag={tag=list,role=L}}
223 }
```

`\l__block_env_params_tl` Declare the variable for the parameter argument; `\@itemlabel` is already declared in L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

```
224 \tl_new:N \l__block_env_params_tl
```

(End definition for `\l__block_env_params_tl`.)

\legacylistsetupcode And here is the extra code for use in the list instance setup inside the key `setup-code`.

```
225 \cs_new:Npn \legacylistsetupcode {
```

Reset values to defaults:

```
226     \dim_zero:N \listparindent
227     \dim_zero:N \rightmargin
228     \dim_zero:N \itemindent
```

By default a list environment is not numbered:

```
229     \tl_set:Nn \clistctr {}
230     \legacy_if_set_false:n { @nmbrlist } % needed if lists are nested
```

By default there is a simple definition for `\makelabel`. It can be overwritten in the second mandatory argument to the list environment (stored in `\l__block_legacy_env_params_tl`) and is used if the instance sets the compatibility key to true.

```
231     \let\makelabel\@mklab % TODO: customize
```

Now we use the argument with parameter settings to update some or all of the above defaults:

```
232     \l__block_legacy_env_params_tl
```

As we don't know much about this list we can only make a guess about the nature of the list and the setting of the tag name (default `list` rolemapped to `L`) and any tag attributes may have to be overwritten in the optional key/value argument. But we do have some hints to play with.

```
233     \legacy_if:nTF { @nmbrlist }
234         { \tl_set:Nn \l__tag_L_attr_class_tl {enumerate} } % numbered list
235         { \tl_if_empty:NTF \itemlabel
236             { \tl_set:Nn \l__tag_L_attr_class_tl {list} } % no label
237             { \tl_set:Nn \l__tag_L_attr_class_tl {itemize} } % unnumbered, unordered
238         }
239 }
```

(End definition for `\legacylistsetupcode`. This function is documented on page ??.)

`trivlist (env.)`

```
240 \AddToHook{begindocument/before}{%
241     \RenewDocumentEnvironment{trivlist}{!O{}}
242         { \list[#1]{}%
243             {
244                 \dim_zero:N \leftmargin
245                 \dim_zero:N \labelwidth
246                 \cs_set_eq:NN \makelabel \use:n
247             }%
248         }%
249     { \endblockenv }%
250 }
```

#### 4.4.5 Theorem-like environments

Theorem-like environments are defined in L<sup>A</sup>T<sub>E</sub>X with the help of `\newtheorem` declarations. Internally they use a list with a single item. For now we keep this approach and only add appropriate tagging support within the internal commands.

\@begintheorem We use `<theorem-like>` as the structure name and rollmap it to a list (`<L>`).  
\@opargbegintheorem

```

251 \tag_if_active:T {
252   \tagpdfsetup{add-new-tag={tag=theorem-like,role=L}}
253 }

```

With that done, we only have to tell the `trivlist` what `tag-name` it should use.

```

254 \def\@begintheorem#1#2{\trivlist[tag-name=theorem-like]%
255   \item[\hskip \labelsep\bfseries #1\ #2]\itshape}
256 \def\@opargbegintheorem#1#2#3{\trivlist[tag-name=theorem-like]
257   \item[\hskip \labelsep\bfseries #1\ #2\ (#3)]\itshape}

```

(End definition for `\@begintheorem` and `\@opargbegintheorem`. These functions are documented on page ??.)

## 4.5 Implementation of templates

### 4.5.1 Implementation of blockenv templates ...

\g\_block\_nesting\_depth\_int LATEX 2<sub>E</sub> already has a counter to record the nesting depth of blocks, but we want our own name because it isn't really tied to "lists" any more. However, `\@listdepth` is really part of the legacy interface (for example `minipage` alters it to point to a different counter) so that we are stuck with using at least indirectly for now and the following line makes this look like an L3 integer variable but internally expands to `\@listdepth`:

```

258 \cs_new:Npn \g_block_nesting_depth_int { \@listdepth } % a fake int
259                                         % for now

```

(End definition for `\g_block_nesting_depth_int`. This function is documented on page ??.)

blockenv display (tempL.)

```

260 \DeclareTemplateCode{blockenv}{display}{1}
261 {
262   env-name      = \l__block_env_name_tl ,
263   tag-name      = \l__block_tag_name_tl ,
264   tag-class     = \l__block_tag_class_tl ,
265   tagging-recipe = \l__block_tagging_recipe_tl ,
266   level-increase = \l__block_level_incr_bool ,
267   setup-code    = \l__block_setup_code_tl ,
268   block-instance = \l__block_block_instance_tl ,
269   para-instance  = \l__block_para_instance_tl ,
270   inner-level-counter = \l__block_inner_level_counter_tl ,
271   max-inner-levels  = \l__block_max_inner_levels_tl ,
272   inner-instance-type = \l__block_inner_instance_type_tl ,
273   inner-instance   = \l__block_inner_instance_tl ,
274   para-flattened  = \l__tag_para_flattened_bool ,
275   final-code     = \l__block_final_code_tl ,
276 }
277 {
278   \__block_debug_typeout:n{\l__block_env_name_tl -env-start}
279 %
280   \tl_if_empty:nF {#1} { \SetTemplateKeys{blockenv}{display}{#1} }
281 %

```

We need to know later if we have nested blockenvs inside a flattened environment. Whenever we start a new blockenv we increment `\l__block_flattened_level_int` if it is already different from zero. If it is zero we increment it if flattening is requested. Thus a value of 0 means no flattening requested so far and 1 means this is the first blockenv requesting flattening. In either case we have to make sure that the blockenv is surrounded by a `text-unit` tag, while for any value above 1 we have to omit the `text-unit`.

```

282   \int_compare:nNnTF \l__block_flattened_level_int > 0
283   {
284     \int_incr:N \l__block_flattened_level_int
285   }
286   {
287     \bool_if:NT \l__tag_para_flattened_bool
288     {
289       \int_incr:N \l__block_flattened_level_int
290     }
291   }
292 %
293 \tl_if_empty:NF \l__block_inner_level_counter_tl
294 {
295   \int_compare:nNnTF \l__block_inner_level_counter_tl >
296   { \l__block_max_inner_levels_tl - 1 }
297   { \c@toodeep }
298   { \int_incr:N \l__block_inner_level_counter_tl } % not clean "o"?
299 }
```

Legacy defaults are only roped in if the list level changes. For display blocks that remain on the same level the current values are kept.

```

300 \bool_if:NT \l__block_level_incr_bool
301 {
302   \int_compare:nNnTF \g_block_nesting_depth_int >
303   { \c@maxblocklevels - 1 }
304   { \c@toodeep }
305   {
306     \int_gincr:N \g_block_nesting_depth_int
```

If there are no legacy defaults for that level then the next line does nothing, i.e., the current values (from the last level) become the defaults for the next.

```

307   \use:c { @list \int_to_roman:n { \g_block_nesting_depth_int } }
308 }
309 }
```

If we are doing tagging we load one of the available recipes for tagging, which alters various kernel hooks to add appropriate tagging structures.

```

310 \tag_if_active:T { \use:c { __block_recipe_ \l__block_tagging_recipe_tl : } }
```

Then run the setup code if any is given in the instance.

```

311 \l__block_setup_code_tl
```

Next call a block instance at the appropriate level passing it any key/value list provided in the optional argument (keys that are not recognized are ignored—currently with an error).

```

312 \__block_debug_typeout:n{use~ instance:~
313   \l__block_block_instance_tl - \int_use:N \g_block_nesting_depth_int }
314 \UseInstance{block}
315   { \l__block_block_instance_tl - \int_use:N }
```

```

316           \g_block_nesting_depth_int }
317 {#1}

```

After the block instance call the para and then inner (list) instance if either or both are specified (which may not be the case).

```

318   \tl_if_empty:NF \l__block_para_instance_tl
319   {
320     \__block_debug_typeout:n{use~ para~ instance:~ \l__block_para_instance_tl }

```

For now we don't offer to alter instance parameters here so we pass an empty argument.

```

321   \UseInstance{para}{ \l__block_para_instance_tl } {}
322 }

```

In the inner instance may have its own levels or none depending on which the instance name differs. Again we pass it the optional key/value list.

```

323   \tl_if_empty:NF \l__block_inner_instance_tl
324   {
325     \__block_debug_typeout:n{use~ instance:~ \l__block_inner_instance_tl
326     \tl_if_empty:NF \l__block_inner_level_counter_tl
327     { - \int_use:N \l__block_inner_level_counter_tl }}
328     \UseInstance{ \l__block_inner_instance_type_tl }
329     { \l__block_inner_instance_tl
330       \tl_if_empty:NF \l__block_inner_level_counter_tl
331       { - \int_use:N \l__block_inner_level_counter_tl } % not clean
332         % use "o"?
333     }
334   }
335 }

```

We finish off with \l\_\_block\_final\_code\_tl which defaults to \ignorespaces so that spaces between \begin{...} and the start of the text are ignored.

```

336   \l__block_final_code_tl
337 }

```

\l\_\_block\_flattened\_level\_int Count the levels of nested blockenvs starting with the first that is “flattened”.

```

338 \int_new:N \l__block_flattened_level_int
(End definition for \l__block_flattened_level_int.)

```

\c@maxblocklevels A counter to increase or decrease the number of supported level. If increased, one needs to supply additional level instances.

```

339 \newcounter{maxblocklevels}
340 \setcounter{maxblocklevels}{6}

```

(End definition for \c@maxblocklevels. This function is documented on page ??.)

\endblockenv The code executed when a blockenv ends is 99% the same for all blockenvs (at least up to now). Small differences exist, though. They are accounted for first in the conditionals.

We make this a public command so that new block environments can be set up without the need to resort to L3 layer programming.

```

341 \cs_new:Npn \endblockenv {
342   \__block_debug_typeout:n{blockenv~ common~ ending \on@line}

```

If this block was incrementing the level we have to decrement it now again:

```

343 \bool_if:NT \l__block_level_incr_bool
344   { \int_gdecr:N \g_block_nesting_depth_int }

```

If this block was a list and there are still `\item` labels to be placed we move to horizontal mode to get them typeset.

```
345  \legacy_if:nT { @inlabel }
346  {
347      \mode_leave_vertical:
348      \legacy_if_gset_false:n { @inlabel }
349 }
```

In a pure “displayblock” scenario `@newlist` will be always false and the code bypassed, but we may have an outer list followed immediately by a displayblock (with the `\item` missing)

```
350  \legacy_if:nT { @newlist }
351  {
352      \noitemerr
353      \legacy_if_gset_false:n { @newlist }
354  }
355 \mode_if_horizontal:TF
356     { \__block_skip_remove_last: \__block_skip_remove_last: \par }
357     { \inmatherr{\end{@currenvir}} }
```

Once we are back in vertical mode we can add the appropriate closing tagging structure(s), if we are doing tagging.

```
358 \__kernel_displayblock_end:
```

What to do in terms of vertical spacing in different situations is still somewhat open to debate, right now this is more or less implementing what L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  list environment have been doing.

```
359 %   \__block_debug_typeout:n{@noparlist} =
360 %           \legacy_if:nTF { @noparlist }{true}{false}
361 \legacy_if:nF { @noparlist }
362 {
363     \__block_skip_set_to_last:N \l_tmpa_skip
364     \dim_compare:nNnT \l_tmpa_skip > \c_zero_dim
365     {
366         \skip_vertical:n { - \l_tmpa_skip }
367         \skip_vertical:n { \l_tmpa_skip + \parskip - \outerparskip }
368     }
369     \addpenalty \endparpenalty
370     \addvspace \l__block_topsepadd_skip
```

L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  triggered the paragraph handling after a list at this point here, i.e., only if the list didn’t start a paragraph. One can make a case for that, but it can be somewhat surprising to the user and there is a good argument that even such a list could be followed explanatory text that is part of the same paragraph and doesn’t start a new one.

```
371 %           \legacy_if_gset_true:n { @endpe }
372 }
```

So this is for now always done. Probably `\l__block_topsepadd_skip` above should be added only if the paragraph ends here and not if it continues, so this need some further cleanup.

```
373 \legacy_if_gset_true:n { @endpe }
374 }
```

(End definition for `\endblockenv`. This function is documented on page ??.)

some redesign/extensions  
here?

decide which logic we  
want to use! If the old  
logic is used we need to  
close the text-unit our-  
selves in the true branch

decide

```
\__kernel_displayblock_end: The kernel hook for tagging at the end of the block.
```

```
375 \cs_new:Npn \__kernel_displayblock_end: {
376   \__block_debug_typeout:n{\detokenize{\__kernel_displayblock_end:}}
377 }
```

```
(End definition for \__kernel_displayblock_end:.)
```

#### 4.5.2 Implementation of para templates ...

```
para std (templ.)
```

```
378 \DeclareTemplateCode{para}{std}{1}
379 {
380   indent-width      = \parindent ,
381   start-skip        = \l__par_start_skip ,                                % name??
382   left-skip         = \leftskip ,
383   right-skip        = \rightskip ,
384   end-skip          = \parfillskip ,
385   fixed-word-spaces = \l__par_fixed_word_spaces_bool , % name??
386   final-hyphen-demerits = \finalhyphendemerits ,
387   cr-cmd            = \\ ,
388   para-class         = \l_tag_para_attr_class_tl ,
389 }
390 {
391   \tl_if_empty:nF {#1} { \SetTemplateKeys{para}{std}{#1} }
392   \skip_set:Nn \rightskip \rightskip
393 }
```

#### 4.5.3 Implementation of block templates ...

```
block display (templ.)
```

```
394 \DeclareTemplateCode{block}{display}{1}
395 {
396   heading          = \l__block_heading_tl ,
397   beginsep         = \topsep ,
398   begin-par-skip  = \partopsep ,
399   par-skip          = \parsep ,
400   end-skip          = \l__block_botsep_skip ,
401   end-par-skip    = \l__block_parbotsep_skip ,
402   beginpenalty     = \beginparpenalty ,
403   endpenalty       = \endparpenalty ,
404   rightmargin      = \rightmargin ,
405   leftmargin        = \leftmargin ,
406   parindent         = \listparindent ,
407 }
408 {
409   \tl_if_empty:nF {#1} { \SetTemplateKeys{block}{display}{#1} }
410   \tl_if_blank:oF \l__block_heading_tl
411     { \mode_leave_vertical: \textbf{\l__block_heading_tl} } % TODO customize
```

The code largely follows the logic of L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub>'s `trivlist` implementation as far as it applicable for the “display block” but coded using the L3 programming layer. However, we keep all the legacy variables (e.g., `@noskipsec`) if there is some chance that they are set in classes or packages.

generalize heading usage  
(or drop?)

```

412     \legacy_if:nT { @noskipsec } { \mode_leave_vertical: }
413     \skip_set:Nn \l__block_topsepadd_skip { \topsep }
414     \mode_if_vertical:TF
415     {
416         \skip_add:Nn \l__block_topsepadd_skip { \partopsep }

```

At this point it is safe to add tagging structure(s) so we have a kernel-owned hook here for tagging. This is used to possibly start a paragraph structure (to surround the block, for example, in case of lists) and possibly do some other preparation for tagging the block.

```

417     \__kernel_displayblock_beginpar_vmode:
418 }
419 {

```

If we are in horizontal mode then the displayblock has to return to vertical mode now (after removing any immediately preceding skip or kern). But before we actually issue the `\par` we execute a kernel hook in which we can add tagging code. This hook is “weird” because by default it does nothing, but if tagging is wanted it takes an argument and grabs the following `\par` in order to put tagging code before and after the `\par`.

```

420     \__block_skip_remove_last: \__block_skip_remove_last:
421     \__kernel_displayblock_beginpar_hmode:w \par
422 }

```

Now we are back to legacy list implementation ...

```

423     \legacy_if:nTF { @inlabel }
424     {
425         \legacy_if_set_true:n { @noparitem }
426         \legacy_if_set_true:n { @noparlist }
427     }
428     {
429         \legacy_if:nT { @newlist } { \@noitemerr }
430         \legacy_if_set_false:n { @noparlist }
431         \skip_set_eq:NN \l__block_effective_top_skip \l__block_topsepadd_skip
432     }
433     \skip_add:Nn \l__block_effective_top_skip { \parskip }

```

Next lines set some paragraph defaults, this may get overwritten if there is a `para-instance` specified on the `blockenv`.

```

434     \skip_zero:N \leftskip
435     \skip_set_eq:NN \rightskip \rightskip
436     \skip_set_eq:NN \parfillskip \flushglue

```

The next lines establish a parshape which is retained across paragraphs by executing `\para_end:` within a group and thus reestablishing the parshape for the next paragraph again. In case a list got started `\par` is ignored until we have seen an `\item` (or we have executed `\par` one thousand times).

```

437     \int_zero:N \par@deathcycles
438     \csetpar
439     {
440         \legacy_if:nTF { @newlist }
441         {
442             \int_incr:N \par@deathcycles
443             \int_compare:nNnTF \par@deathcycles > { 1000 }
444             {
445                 \@noitemerr
446                 { \para_end: }
447             }

```

```

447     }
448     {
449         { \para_end: }
450     }
451 }
452 \skip_set_eq:NN \outerparskip \parskip
453 \skip_set_eq:NN \parskip \parsep
454 \dim_set_eq:NN \parindent \listparindent
455 \dim_add:Nn \linewidth { - \rightmargin - \leftmargin }
456 \dim_add:Nn \totalleftmargin { \leftmargin }
457 \tex_parshape:D 1 ~ \totalleftmargin \linewidth

```

This is the point where we are ready to add the tagging structure for the block, e.g., an <L>, a <Figure> or some other structure.

```
458     __kernel_displayblock_begin:
```

Finally, we have to output the vertical separation and penalty at the start of the block and make corrections for a change in \parskip and some other housekeeping, unless this block is inside a list and the list \item has not yet placed. In that case the vertical space and penalty us suppressed. This is controloed through the legacy switches @noparitem, minipage, and @nobreak.

```

459     \legacy_if:nTF { @noparitem }
460     {
461         \legacy_if_set_false:n { @noparitem }
462         \hbox_gset:Nn \g__block_labels_box
463         {
464             \skip_horizontal:n { - \leftmargin }
465             \hbox_unpack_drop:N \g__block_labels_box
466             \skip_horizontal:n { \leftmargin }
467         }
468         \legacy_if:nF { @minipage } % Why this chunk of code?
469         {
470             \__block_skip_set_to_last:N \l__block_tma_skip
471             \skip_vertical:n { - \l__block_tma_skip }
472             \skip_vertical:n { \l__block_tma_skip + \outerparskip - \parskip }
473         }
474     }
475     {
476         \legacy_if:nTF { @nobreak }
477         { \addvspace{\skip_eval:n{\outerparskip-\parskip}} }
478         {
479             \addpenalty \beginparpenalty
480             \addvspace \l__block_effective_top_skip
481             \addvspace{-\parskip}
482         }
483     }
484 }
```

document 2e logic used here

Extra keys to support enumitem conventions:

```

485 \keys_define:nn { template/block/display }
486 {
487     ,topsep      .skip_set:N = \topsep
488     ,partopsep   .skip_set:N = \partopsep
489     ,listparindent .skip_set:N = \listparindent

```

```
490 }
```

The internal kernel hooks for tagging.

```
491 \cs_new:Npn \__kernel_displayblock_begin: {
492     \__block_debug_typeout:n{\detokenize{\__kernel_displayblock_begin:}}
493 }
494 \cs_new:Npn \__kernel_displayblock_beginpar_hmode:w {
495     \__block_debug_typeout:n{\detokenize{\__kernel_displayblock_beginpar_hmode:w}}
496 }
497 \cs_new:Npn \__kernel_displayblock_beginpar_vmode: {
498     \__block_debug_typeout:n{\detokenize{\__kernel_displayblock_beginpar_vmode:}}
499 }

(End definition for \__kernel_displayblock_begin:, \__kernel_displayblock_beginpar_hmode:w, and
\__kernel_displayblock_beginpar_vmode:.)
```

#### 4.5.4 Implementation of list templates ...

\@itemlabel  
  \@listctr

Both \@itemlabel and \@listctr from the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  list implementation are used (or set) by various packages. We therefore use them too, so that these packages have a fighting chance to work with the new tagging-aware implementation for list.

```
500 \tl_new:N \@itemlabel % should have a top-level definition
501 \tl_new:N \@listctr % should have a top-level definition
```

(End definition for \@itemlabel and \@listctr. These functions are documented on page ??.)

list std (templ.)

This template implements numbered and unnumbered lists and can be combined with display blocks or with inline blocks.

```
502 \DeclareTemplateCode{list}{std}{1}
503 {
504     counter      = \l__block_counter_tl,
505     item-label   = \l__block_item_label_tl,
506     start        = \l__block_counter_start_int ,
507     resume       = \l__block_resume_bool ,
508     item-instance = \l__block_item_instance:n ,
509     item-skip    = \itemsep ,
510     % item-par-skip = \parsep ,
511     item-penalty  = \itempenalty ,
512     item-indent   = \itemindent ,
513     label-width   = \labelwidth ,
514     label-sep     = \labelsep ,
515     legacy-support = \l__block_legacy_support_bool , % FMI questionable
516 }
517 {
518     \__block_debug_typeout:n{template:list:std}
519 %
520     \tl_if_empty:nF {#1} { \SetTemplateKeys{list}{std}{#1} }
```

Has this list a counter name defined in the instance?

```
521 \tl_if_empty:NTF \l__block_counter_tl
522     {
```

If not we check if `\@listctr` has a non-empty value to be used for the list counter.

We better test for blank not empty in case somebody had defined `\@listctr` using `\renewcommand` or `\cs_set:Npn`.

```
523     \tl_if_blank:oF \@listctr
524     {
```

In that case `@nmbrlist` should have been set too, for example, through `\usecounter`, so we do not set it explicitly. However, we check if we should resume a previous list.

```
525         \bool_if:NF \l__block_resume_bool
526         {
527             \int_gset:cn{ c@ \@listctr }
528             { \l__block_counter_start_int - 1 }
529         }
530     }
```

If `\@listctr` is not set then we have definitely an unnumbered list.

```
531     { \@nmbrlistfalse }
532 }
```

If a counter is set in the list instance we use that one. This should be the name of a L<sup>A</sup>T<sub>E</sub>X counter that is already allocated externally—no runtime check is made for this: if it is not declared one will get “no such counter” error when the list is used.

```
533     {
534         \@nmbrlisttrue
535         \tl_set_eq:NN \@listctr \l__block_counter_tl
536         \bool_if:NF \l__block_resume_bool
537         {
538             \int_gset:cn{ c@ \@listctr }
539             { \l__block_counter_start_int - 1 }
540         }
541     }
```

Does the current instance has an item label representation? This would be possible whether or not we have a numbered list. If yes, then we use this for `\@itemlabel`, otherwise we expect that `\@itemlabel` is provided from the outside, e.g., as part of the `list` environment argument.

```
542     \tl_if_empty:NF \l__block_item_label_tl
543     {
544         \tl_set_eq:NN \@itemlabel \l__block_item_label_tl
545     }
```

finally, we signal that we are at the start of a new list (which effects how the first `\item` is handled and how `\par` commands are interpreted).

```
546     \legacy_if_gset_true:n { @newlist }
547     \__block_debug_typeout:n{template:list:std~end}
548 }
```

Extra keys to support enumitem conventions:

```
549 \keys_define:nn { template/list/std }
550 {
551     ,nosep .code:n =
552         \dim_zero:N \itemsep
553         \dim_zero:N \parsep
554         \dim_zero:N \topsep
555         \dim_zero:N \l__block_botsep_skip
```

```

556     \dim_zero:N \l__block_parbotsep_skip
557     ,midsep     .skip_set:N = \topsep
558 }

```

#### 4.5.5 Implementation of \item template(s)

`item std (templ.)` The item template has one hidden key `label` which is not available on the template for setting because it is only used to receive any optional data passed to the `\item` command. We therefore declare it with `\keys_define:nn` and ensure that the optional argument data to `\item` (if it is not a key/value list already) is passed to this `label` key.

```

559 \keys_define:nn { template/item/std }
560           { label .tl_set:N = \l__block_label_given_tl }
561 \DeclareTemplateCode{item}{std}{1}
562 {
563     counter-label    = \l__block_counter_label:n ,
564     counter-ref      = \l__block_counter_ref:n ,
565     label-ref        = \l__block_label_ref:n ,
566     label-autoref    = \l__block_label_autoref:n ,
567     label-format     = \l__block_label_format:n ,
568     label-strut       = \l__block_label_strut_bool ,
569     label-boxed      = \l__block_label_boxed_bool ,
570     next-line        = \l__block_next_line_bool ,
571     text-font        = \l__block_text_font_tl ,
572     compatibility    = \l__block_item_compatibility_bool ,

```

alignment is mostly wrong  
(test short medium and  
multiline labels)

next set of key not yet  
used

complete

This probably needs a different implementation (and needs completing)

```

573     label-align     = {
574         left      = \tl_set:Nn \l__block_item_align_tl { \relax \hss } ,
575         center   = \tl_set:Nn \l__block_item_align_tl { \hss \hss } ,
576         right    = \tl_set:Nn \l__block_item_align_tl { \hss \relax } ,
577         parleft  = \NOT_IMPLEMENTED ,
578     } ,
579 }

```

Then typeset the label at its natural width by applying `\l__block_make_label_box:n` to the label given or to a label constructed from the counter. If it is boxed and reasonably short, add padding to make it at least of size `\labelwidth`, then add another layer of box. This way, when we unpack it in `\g__block_labels_box` it correctly remains boxed in those cases. Afterwards, in the `newline` case add `\newline` if the label did not fit in the allotted space.

```

580 {
581     \l__block_debug_typeout:n{template:item:std}

```

First deal with the key-value input, which in particular may provide a value for the label (the usual optional argument of `\item`). For this we set `\l__block_label_given_tl` to `\c_novalue_tl` so that we can identify if an optional argument was given.

```

582     \tl_set_eq:NN \l__block_label_given_tl \c_novalue_tl
583     \tl_if_empty:nF{#1}{ \SetTemplateKeys{item}{std}{#1} }

```

If no optional argument was given then `\l__block_label_given_tl` is still equal to `\c_novalue_tl` and so we can distinguish that from `\item[]`.

```

584     \tl_if_novalue:oTF \l__block_label_given_tl
585     {

```

fix

The rest of the code for this template needs work and is both incomplete and partly wrong.

```
586     \tl_if_blank:oF \clistctr { \kernel@refstepcounter \clistctr }
587     \bool_if:NTF \l__block_item_compatibility_bool    % not sure that conditional
588                                         % makes sense
589     { \__block_make_label_box:n { \MakeLinkTarget[\clistctr]{\itemlabel} } } % TODO ?
590     { \__block_make_label_box:n { \MakeLinkTarget[\clistctr]{\__block_counter_label:n} } }
591   }
592   {
593     \__block_debug_typeout:n{item~ with~ optional}
594     \__block_make_label_box:n { \l__block_label_given_tl } }
595 \bool_if:nT
596   {
597     \l__block_label_boxed_bool
598     && \dim_compare_p:n { \box_wd:N \l__block_one_label_box } <= \ linewidth } % TODO: is \l_
599   }
600   {
601     \dim_compare:nNnT
602       { \box_wd:N \l__block_one_label_box } < \labelwidth
603     {
604       \hbox_set_to_wd:Nnn \l__block_one_label_box { \labelwidth }
605       {
606         \exp_after:wN \use_i:nn \l__block_item_align_tl
607       }
608     }
609   }
```

FMi: L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> keeps the label boxed inside (not unboxed). This means that the content stays rigid and does not vary based on glue setting in the line with the label. There are cases where we do want the unboxed version (I think enumitem offers that in some cases too) but it should probably not be the default.

```
607 %
608           \hbox_unpack_drop:N \l__block_one_label_box    %TODO: customize?
609           \box_use_drop:N \l__block_one_label_box
610
611           \exp_after:wN \use_i:nn \l__block_item_align_tl
612         }
613       }
614     }
615   \dim_compare:nNnTF { \box_wd:N \l__block_one_label_box } > \labelwidth
616     { \bool_set_true:N \l__block_long_label_bool }
617     { \bool_set_false:N \l__block_long_label_bool }
618 \hbox_gset:Nn \g__block_labels_box
619   {
620     \hbox_unpack_drop:N \g__block_labels_box
621     \skip_horizontal:n { \itemindent - \labelsep - \labelwidth }
622     \hbox_unpack_drop:N \l__block_one_label_box
623     \skip_horizontal:n { \labelsep }
624     \bool_if:NT \l__block_next_line_bool
625       { \bool_if:NT \l__block_long_label_bool { \nobreak \hfil \break } }
626     % version of \newline inside an hbox that will be unpacked
627   }
628 % \skip_set_eq:NN \parsep \l__block_item_parsep_skip TODO??? FMi
629                                         % what's that?
630 \dim_set_eq:NN \parindent \listparindent
```

Placing the list label(s) is done when the paragraph for the `\item` is started, which executes `\__block_item_everypar:` inside `para/begin`. By default this command does nothing, now we change it to attach the pending label or labels.

```
631     \cs_set_eq:NN \__block_item_everypar: \__block_item_everypar_std:
632 }
```

`\l__block_one_label_box` `\g__block_labels_box` Each label is typeset in `\l__block_one_label_box` to be measured. Once this is ready, it is put (boxed or unboxed) in `\g__block_labels_box`, together with any pending labels (for the case where a list begins just after `\item`). This is an analogue of L<sup>A</sup>T<sub>E</sub>X 2<sub>&</sub>'s `\@labels`, but it is always unboxed before use, to support both boxed and unboxed labels.

```
633 \box_new:N \l__block_one_label_box
634 \box_new:N \g__block_labels_box
```

(End definition for `\l__block_one_label_box` and `\g__block_labels_box`.)

`\l__block_long_label_bool` Track whether the `\l__block_one_label_box` is larger than `\labelwidth`.

```
635 \bool_new:N \l__block_long_label_bool
```

(End definition for `\l__block_long_label_bool`.)

`\__block_make_label_box:n` `\__block_label_format:x` Make one label, wrapped in `\__block_label_format:n`, with an appropriate `\strut` and possibly `\makelabel` in compatibility mode (used for the `list` environment).

```
636 \cs_new_protected:Npn \__block_make_label_box:n #1
637 {
638     \hbox_set:Nn \l__block_one_label_box
639 }
```

If we do tagging then the contents of this box may need to be wrapped into a structure, e.g., `<Lbl>`.

```
640     \__kernel_list_label_begin:
641     \__block_label_format:n
642     {
643         \bool_if:NT \l__block_label_strut_bool { \strut }
644         \bool_if:NTF \l__block_legacy_support_bool
645             \makelabel
646             \use:n
647             {#1}
648     }
```

And what gets opened also needs closing:

```
649     \__kernel_list_label_end:
650 }
651 }
```

(End definition for `\__block_make_label_box:n` and `\__block_label_format:x`.)

`\__kernel_list_label_begin:` If we aren't doing tagging the kernel hooks do nothing.

```
652 \cs_new_eq:NN \__kernel_list_label_begin: \prg_do_nothing:
653 \cs_new_eq:NN \__kernel_list_label_end: \prg_do_nothing:
```

(End definition for `\__kernel_list_label_begin:` and `\__kernel_list_label_end:)`)

```
\_\_block\_item\_everypar: The \_\_block\_item\_everypar: command is executed as part of para/begin but most
\_\_block\_item\_everypar\_std: of the time does nothing, i.e., it has the following default definition.
```

```
654 \cs_new_eq:NN \_\_block\_item\_everypar: \prg_do_nothing:
655 \AddToHook{para/begin}[lists]{\_\_block\_item\_everypar:}
```

Note that we have to make sure that the above code is executed after the hook chunk from tagpdf because the latter uses @inlabel to make a decision.

By the end of the day both should probably move into the kernel hook instead!

```
656 \DeclareHookRule{para/begin}{lists}{after}{tagpdf}
```

What follows is the version that resets various legacy booleans and puts the label box in the right place and finally resets itself to do nothing next time. \\_\\_block\\_item\\_everypar: is set to this by the item template so that the next paragraph start runs the code below.

```
657 \cs_new_protected:Npn \_\_block\_item\_everypar\_std: {
658     \_\_block_debug_typeout:n{item~ everypar \on@line }
659     \legacy_if_set_false:n { @minipage }
660     \legacy_if_gset_false:n { @newlist }
661     \legacy_if:nT { @inlabel }
662     {
663         \legacy_if_gset_false:n { @inlabel }
664         \box_if_empty:NT \g_para_indent_box { \kern - \itemindent }
665         \para omit indent:
666         \box_use_drop:N \g_\_block_labels_box
```

After the labels are placed we start a paragraph structure (if appropriate). This is handled in the following kernel hook:

```
667     \_\_kernel_list_label_after:
668     \penalty \c_zero_int
669 }
670 \legacy_if:nTF { @nobreak }
671 {
672     \legacy_if_gset_false:n { @nobreak }
673     \int_set:Nn \clubpenalty { 10000 }
674 }
675 {
676     \int_set_eq:NN \clubpenalty \clubpenalty
```

Once the label(s) are typeset and we are past any special @nobreak handling we reset \\_\\_block\\_item\\_everypar: to do nothing.

```
677     \cs_set_eq:NN \_\_block\_item\_everypar: \prg_do_nothing:
678 }
679 }
```

(End definition for \\_\\_block\\_item\\_everypar: and \\_\\_block\\_item\\_everypar\\_std:.)

```
\_\_kernel_list_label_after:
680 \cs_new_eq:NN \_\_kernel_list_label_after: \prg_do_nothing:
(End definition for \_\_kernel_list_label_after:.)

\l_\_block_tmpa_skip
681 \skip_new:N \l_\_block_tmpa_skip
```

(End definition for `\l_block_tmpa_skip`.)

`\l_block_topsepadd_skip` Variables equivalent to L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub>'s `\@topsepadd` and `\@topsep`. Roughly equal to a mixture of `topsep`, `partopsep`, and various `parskip` at different nesting levels in lists. The code is really elaborate when `@inlabel` is true.

```
682 \skip_new:N \l_block_topsepadd_skip  
683 \skip_new:N \l_block_effective_top_skip
```

(End definition for `\l_block_topsepadd_skip` and `\l_block_effective_top_skip`.)

`\item` Here we already have all the building blocks. Complain in math mode. Distinguish between first item (do necessary tagging) and later items `\__block_inter_item`: to cleanly close what's before, then call `\__block_item_instance:n` (which calls `\UseInstance{item}{(instance)}`) to prepare the upcoming item: it will be actually inserted only once some later material triggers `\everypar`.

```
684 \AddToHook{begindocument/before}{  
685   \RenewDocumentCommand{\item}{ ={label}o }  
686   {  
687     \@inmatherr \item
```

TODO: Test for being outside of a list needs updating!

```
688   \tl_if_empty:oTF \__block_item_instance:n %%FMi?  
689   { \msg_error:nnn { __block } { item-in-nonlist } { \item[{\#1}] } }  
690   {  
691     \legacy_if:nTF { @newlist }  
692       { \__kernel_list_item_begin: }  
693       { \__block_inter_item: }
```

To avoid unnecessary key/val processing we make a quick check if there was an optional argument.

```
694   \tl_if_novalue:nTF {\#1} % avoids reparsing label={}  
695   { \__block_item_instance:n { } }  
696   { \__block_item_instance:n {\#1} }
```

Set the legacy switch that signals that we have a pending item label:

```
697   \legacy_if_gset_true:n { @inlabel }  
698   \ignorespaces  
699   }  
700 }  
701 }
```

(End definition for `\item`. This function is documented on page ??.)

`\__block_inter_item`: Between items. If the previous item had no content then we need to trigger `\everypar`. Otherwise we simply close the previous item with `\par` after removing some horizontal space. Between items, there is a penalty and some space.

```
702 \cs_new_protected:Npn \__block_inter_item: {  
703   \legacy_if:nT { @inlabel }  
704     { \indent \par } % case of \item\item
```

`\par` may have a strange definition and may not get us back to vertical mode in one go, so we better do not treat the next line as an else case to the above conditional (for now).

```
705   \mode_if_horizontal:T { \__block_skip_remove_last:  
706     \__block_skip_remove_last: \par }
```

End any LI-tag, then start the next LI-tag (if doing tagging):

```

707   \__kernel_list_item_end:
708   \__kernel_list_item_begin:
709   \addpenalty \citempenalty
710   \addvspace \itemsep
711 }
```

(*End definition for \\_\_block\_inter\_item::*)

```
\__kernel_list_item_begin:
\__kernel_list_item_end:
712 \cs_new_eq:NN \__kernel_list_item_begin: \prg_do_nothing:
713 \cs_new_eq:NN \__kernel_list_item_end: \prg_do_nothing:
(End definition for \__kernel_list_item_begin: and \__kernel_list_item_end::)
```

## 4.6 Tagging recipes

\\_\_block\_recipe\_basic:

The **basic** recipe simply ensures that the block is inside a **text-unit** structure and if necessary starts one. When the block ends and is followed by a blank line the **text-unit** structure is closed too, otherwise it remains open and further text starts with just a **<text>** structure.

There is otherwise no inner structure so **\\_\_kernel\_displayblock\_begin:** and **\\_\_kernel\_displayblock\_end:** do nothing—blockenvs with inner structure use the **standard** or **list** recipe instead.

```

714 \cs_new:Npn \__block_recipe_basic: {
715   \cs_set_eq:NN \__kernel_displayblock_beginpar_hmode:w
716                                         \__block_beginpar_hmode:N
717   \cs_set_eq:NN \__kernel_displayblock_beginpar_vmode:
718                                         \__block_beginpar_vmode:
719   \let \__kernel_displayblock_begin: \prg_do_nothing:
720   \let \__kernel_displayblock_end: \prg_do_nothing:
721 }
```

(*End definition for \\_\_block\_recipe\_basic::*)

\\_\_block\_recipe\_standard:

The **standard** recipe does the following:

- surround the block with a **text-unit**-structure if not already in a **text-unit**. In the latter case end the MC and the **<text>** but leave the **text-unit** open.  
If we are producing flattened paragraphs, just close any **<text>** but do not open a **text-unit**.
- Then open an new (inner) structure (by default **Figure** but typically the one specified on the instance).
- At the end of the block close the the inner structure (**Figure** or explicit one) but leave the **text-unit** open to be either continued or closed due to a following **\par**.

```

722 \cs_new:Npn \__block_recipe_standard:
723 {
724   \cs_set_eq:NN \__kernel_displayblock_beginpar_hmode:w
725                                         \__block_beginpar_hmode:N
726   \cs_set_eq:NN \__kernel_displayblock_beginpar_vmode:
727                                         \__block_beginpar_vmode:
728   \cs_set_eq:NN \__kernel_displayblock_begin: \__block_inner_begin:
729   \cs_set_eq:NN \__kernel_displayblock_end: \__block_inner_end:
```

```

730   \tl_if_empty:NTF \l__block_tag_name_tl
731     { \tl_set:Nn \l__block_tag_inner_tag_tl {Figure} }
732     { \tl_set_eq:NN \l__block_tag_inner_tag_tl \l__block_tag_name_tl }
733 }

(End definition for \__block_recipe_standard::)
```

```
\l__block_tag_inner_tag_tl
734 \tl_new:N \l__block_tag_inner_tag_tl

(End definition for \l__block_tag_inner_tag_tl.)
```

\\_\_block\_recipe\_list: The `list` recipe does the following.

- It opens a `<text-unit>`-structure or keeps the current one open (only closing the MC).
- It then starts a new structure rollmapped to L-structure and arranges for handling list items, e.g., Li, Lbl and LBody structures.
- At the end it closes open list structures as needed but keeps the `<text-unit>`-structure open to continue the paragraph after the list, if necessary.

```

735 \cs_new:Npn \__block_recipe_list:
736 {
737   \cs_set_eq:NN \__kernel_displayblock_beginpar_hmode:w
738                                     \__block_beginpar_hmode:N
739   \cs_set_eq:NN \__kernel_displayblock_beginpar_vmode:
740                                     \__block_beginpar_vmode:
741   \cs_set_eq:NN \__kernel_displayblock_begin: \__block_list_begin:
742   \cs_set_eq:NN \__kernel_displayblock_end: \__block_list_end:
```

The next two lines could be done globally, because they are only called if we do have `\items`, i.e., if we are in a list. It is therefore also not necessary to reset them in other recipes (right now—this may change if we get more templates (like inline lists)).

```

743   \cs_set_eq:NN \__kernel_list_item_begin: \__block_list_item_begin:
744   \cs_set_eq:NN \__kernel_list_item_end: \__block_list_item_end:
```

Handle the tag name and attribute classes using the key values from the current list instance.

```

745   \tl_if_empty:NTF \l__block_tag_name_tl
746     { \tl_set:Nn \l__tag_L_tag_tl {L} }
747     { \tl_set_eq:NN \l__tag_L_tag_tl \l__block_tag_name_tl }
748   \tl_if_empty:NTF \l__block_tag_class_tl
749     { \tl_set:Nn \l__tag_L_attr_class_tl {} }
750     { \tl_set_eq:NN \l__tag_L_attr_class_tl \l__block_tag_class_tl }
751 }
```

(End definition for \\_\_block\_recipe\_list::)

## 4.7 Blockenv instances

### 4.7.1 Basic instances

```
blockenv displayblock (inst.)
 752 \DeclareInstance{blockenv}{displayblock}{display}
 753 {
 754   env-name      = displayblock,
 755   tag-name      = ,
 756   tag-class     = ,
 757   tagging-recipe = standard,
 758   inner-level-counter = ,
 759   level-increase = false,
 760   setup-code    = ,
 761   block-instance = displayblock ,
 762   inner-instance = ,
 763 }
```

```
nv displayblockflattened (inst.)
 764 \DeclareInstance{blockenv}{displayblockflattened}{display}
 765 {
 766   env-name      = displayblockflattened,
 767   tag-name      = ,
 768   tag-class     = ,
 769   tagging-recipe = basic,
 770   inner-level-counter = ,
 771   level-increase = false,
 772   setup-code    = ,
 773   block-instance = displayblock ,
 774   para-flattened = true ,
 775   inner-instance = ,
 776 }
```

```
blockenv center (inst.)
 777 \DeclareInstance{blockenv}{center}{display}
 778 {
 779   env-name      = center,
 780   tag-name      = ,
 781   tag-class     = ,
 782   tagging-recipe = basic,
 783   inner-level-counter = ,
 784   level-increase = false,
 785   setup-code    = ,
 786   block-instance = displayblock ,
 787   para-flattened = true ,
 788   para-instance  = center ,
 789   inner-instance = ,
 790 }
```

```
blockenv flushleft (inst.)
 791 \DeclareInstance{blockenv}{flushleft}{display}
 792 {
 793   env-name      = flushleft,
 794   tag-name      = ,
```

```

795  tag-class      = ,
796  tagging-recipe = basic,
797  inner-level-counter = ,
798  level-increase = false,
799  setup-code     = ,
800  block-instance = displayblock ,
801  para-flattened = true ,
802  para-instance  = raggedright ,
803  inner-instance = ,
804 }

blockenv flushright (inst.)
805 \DeclareInstance{blockenv}{flushright}{display}
806 {
807   env-name      = flushleft,
808   tag-name      = ,
809   tag-class     = ,
810   tagging-recipe = basic,
811   inner-level-counter = ,
812   level-increase = false,
813   setup-code    = ,
814   block-instance = displayblock ,
815   para-flattened = true ,
816   para-instance  = raggedleft ,
817   inner-instance = ,
818 }

```

#### 4.7.2 Blockquote instances

```

blockenv quotation (inst.)
819 \tag_if_active:T {
820   \tagpdfsetup{add-new-tag={tag=quote,role=BlockQuote}}
821   \tagpdfsetup{add-new-tag={tag=quotation,role=BlockQuote}}
822 }

823 \DeclareInstance{blockenv}{quotation}{display}
824 {
825   env-name      = quotation,
826   tag-name      = quotation,
827   tag-class     = ,
828   tagging-recipe = standard,
829   inner-level-counter = ,
830   level-increase = true,
831   setup-code    = ,
832   block-instance = quotationblock ,
833   inner-instance = ,
834 }

blockenv quote (inst.)
835 \DeclareInstance{blockenv}{quote}{display}
836 {
837   env-name      = quote,
838   tag-name      = quote,
839   tag-class     = ,

```

```

840   tagging-recipe = standard,
841   inner-level-counter = ,
842   level-increase = true,
843   setup-code = ,
844   block-instance = quoteblock ,
845   inner-instance = ,
846 }
```

I guess the setup code is still executed too early, have to check.

An alternative setup for quotations, using the displayblock instance and just overwrite a bit in the setup code. This would be less flexible but would ensure visual consistency, because the displayblock settings are used throughout.

```

847 % \DeclareInstance{blockenv}{quotation}{display}
848 % {
849 %   env-name      = quotation,
850 %   tag-name      = ,
851 %   tag-class     = ,
852 %   tagging-recipe = blockquote,
853 %   inner-level-counter = ,
854 %   level-increase = true,
855 %   setup-code    = \setlength\rightmargin{\leftmargin}
856 %                   \setlength\parsep{1.5em} ,
857 %   block-instance = displayblock ,
858 %   inner-instance = ,
859 % }
```

```

860 % \DeclareInstance{blockenv}{quote}{display}
861 % {
862 %   env-name      = quote,
863 %   tag-name      = ,
864 %   tag-class     = ,
865 %   tagging-recipe = blockquote,
866 %   inner-level-counter = ,
867 %   level-increase = true,
868 %   setup-code    = \setlength\rightmargin{\leftmargin} ,
869 %   block-instance = displayblock ,
870 %   inner-instance = ,
871 % }
```

#### 4.7.3 Verbatim instances

**blockenv verbatim** (*inst.*)

```

872 \tag_if_active:T {
873   \tagpdfsetup{add-new-tag={tag=verbatim,role=P}}
874   \tagpdfsetup{add-new-tag={tag=codeline,role=Sub}}
```

Possible alternative for PDF 1.7:

```

875 % \tagpdfsetup{add-new-tag={tag=verbatim,role=Div}}
876 % \tagpdfsetup{add-new-tag={tag=codeline,role=P}}
877 %

878 \DeclareInstance{blockenv}{verbatim}{display}
879 {
880   env-name      = verbatim,
881   tag-name      = verbatim,
882   tag-class     = ,
```

```

883 tagging-recipe = standard,
884 inner-level-counter = ,
885 level-increase = false,
886 setup-code = ,
887 block-instance = displayblock ,
888 inner-instance = ,
889 final-code = \legacyverbatimsetup ,
890 }

```

#### 4.7.4 Standard list instances

`blockenv itemize (inst.)`

```

891 \DeclareInstance{blockenv}{itemize}{display}
892 {
893   env-name      = itemize,
894   tag-name      = itemize,
895   tag-class     = itemize,
896   tagging-recipe = list,
897   inner-level-counter = \@itemdepth,
898   level-increase = true,
899   max-inner-levels = 4,
900   setup-code    = ,
901   block-instance = list ,
902   inner-instance = itemize ,
903 }

```

`blockenv enumerate (inst.)`

```

904 \DeclareInstance{blockenv}{enumerate}{display}
905 {
906   env-name      = enumerate,
907   tag-name      = enumerate,
908   tag-class     = enumerate,
909   tagging-recipe = list,
910   level-increase = true,
911   setup-code    = ,
912   block-instance = list ,
913   inner-level-counter = \@enumdepth,
914   max-inner-levels = 4,
915   inner-instance = enum ,
916 }

```

`blockenv description (inst.)`

```

917 \DeclareInstance{blockenv}{description}{display}
918 {
919   env-name      = description,
920   tag-name      = description,
921   tag-class     = description,
922   tagging-recipe = list,
923   inner-level-counter = ,
924   level-increase = true,
925   setup-code    = ,
926   block-instance = list ,
927   inner-instance = description ,
928 }

```

```

929 }

blockenv list (inst.) The general (legacy) list environment does some of its setup in the setup-code key.
930 \DeclareInstance{blockenv}{list}{display}
931 {
932   env-name      = list,
933   tag-name      = list,
934   tag-class     = ,
935   tagging-recipe = list,
936   level-increase = true,
937   setup-code    = \legacylistsetupcode ,
938   block-instance = list ,
939   inner-level-counter = ,
940   inner-instance = legacy ,
941 }

```

## 4.8 Block instances

### 4.8.1 Displayblock instances

We provide 6 nesting levels (as in L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> ). If you want to provide more you need to change the `maxblocklevels` counter, offer further `displayblock-xx` instances but also define further (legacy) `\list<romannumerals>` commands for the defaults. If not, then the settings from the previous level are reused automatically—which may or may not be good enough).

```

942 \setcounter{maxblocklevels}{6}

block displayblock-0 (inst.) Here we need level zero as well in case a flattened displayblock (like the center env) it is
block displayblock-1 (inst.) used on top-level.
block displayblock-2 (inst.) 943 \DeclareInstance{block}{displayblock-0}{display}
block displayblock-3 (inst.) 944 {
block displayblock-4 (inst.) 945   leftmargin      = Opt ,
block displayblock-5 (inst.) 946   parindent       = Opt ,
block displayblock-6 (inst.) 947 }
948 \DeclareInstanceCopy{block}{displayblock-1}{displayblock-0}
949 \DeclareInstanceCopy{block}{displayblock-2}{displayblock-0}
950 \DeclareInstanceCopy{block}{displayblock-3}{displayblock-0}
951 \DeclareInstanceCopy{block}{displayblock-4}{displayblock-0}
952 \DeclareInstanceCopy{block}{displayblock-5}{displayblock-0}
953 \DeclareInstanceCopy{block}{displayblock-6}{displayblock-0}

```

### 4.8.2 Quote/quotationblock instances

Quote and quotation are not flattened, i.e., they change levels, thus they start with level 1 not 0.

```

block quoteblock-1 (inst.) Default layout is to indent equally from both side.
block quoteblock-2 (inst.) 954 \DeclareInstance{block}{quoteblock-1}{display}
block quoteblock-3 (inst.) 955 { rightmargin = \KeyValue{leftmargin} }
block quoteblock-4 (inst.)
block quoteblock-5 (inst.)
block quoteblock-6 (inst.)

```

```

956 \DeclareInstanceCopy{block}{quoteblock-2}{quoteblock-1}
957 \DeclareInstanceCopy{block}{quoteblock-3}{quoteblock-1}
958 \DeclareInstanceCopy{block}{quoteblock-4}{quoteblock-1}
959 \DeclareInstanceCopy{block}{quoteblock-5}{quoteblock-1}
960 \DeclareInstanceCopy{block}{quoteblock-6}{quoteblock-1}

block quotationblock-1 (inst.) Quotation additionally changes the parindent.
block quotationblock-2 (inst.) 961 \DeclareInstance{block}{quotationblock-1}{display}
block quotationblock-3 (inst.) 962 { parindent = 1.5em , rightmargin = \KeyValue{leftmargin} }
block quotationblock-4 (inst.) 963 \DeclareInstanceCopy{block}{quotationblock-2}{quotationblock-1}
block quotationblock-5 (inst.) 964 \DeclareInstanceCopy{block}{quotationblock-3}{quotationblock-1}
block quotationblock-6 (inst.) 965 \DeclareInstanceCopy{block}{quotationblock-4}{quotationblock-1}
                           966 \DeclareInstanceCopy{block}{quotationblock-5}{quotationblock-1}
                           967 \DeclareInstanceCopy{block}{quotationblock-6}{quotationblock-1}

```

#### 4.8.3 Block instances for the standard lists

```

block list-1 (inst.) The block instances for the various list environments use the same underlying instance
block list-2 (inst.) (well by default) and nothing nothing needs to be set up specifically (because that is
block list-3 (inst.) already done in the legacy \list<romannumerical> unless a different layout is wanted.
block list-4 (inst.) 968 \DeclareInstance{block}{list-1}{display}{}
block list-5 (inst.) 969 % heading      = ,
block list-6 (inst.) 970 % beginsep     = \topsep ,
                           971 % begin-par-skip = \partopsep ,
                           972 % par-skip       = \parsep ,
                           973 % end-skip        = \KeyValue{beginsep} ,
                           974 % end-par-skip   = \KeyValue{begin-par-skip} ,
                           975 % beginpenalty   = \UserName{@beginparpenalty} ,
                           976 % endpenalty     = \UserName{@endparpenalty} ,
                           977 % leftmargin     = \leftmargin ,
                           978 % rightmargin    = \rightmargin ,
                           979 % parindent      = \listparindent ,
                           980 }
                           981 \DeclareInstance{block}{list-2}{display}{}
                           982 \DeclareInstance{block}{list-3}{display}{}
                           983 \DeclareInstance{block}{list-4}{display}{}
                           984 \DeclareInstance{block}{list-5}{display}{}
                           985 \DeclareInstance{block}{list-6}{display}{}

```

#### 4.9 List instances for the standard lists

For all list instances we have to say what kind of label we want (`label-instance`) and how it should beformatted.

```

list itemize-1 (inst.) For itemize environments this is all we need to do and we refer back to the external
list itemize-2 (inst.) definitions rather than defining the item-label code in the instance to ensure that old
list itemize-3 (inst.) documents still work.
list itemize-4 (inst.) 986 \DeclareInstance{list}{itemize-1}{std}{ item-label = \labelitemi }
                           987 \DeclareInstance{list}{itemize-2}{std}{ item-label = \labelitemii }
                           988 \DeclareInstance{list}{itemize-3}{std}{ item-label = \labelitemiii }
                           989 \DeclareInstance{list}{itemize-4}{std}{ item-label = \labelitemiv }

```

`list enumerate-1 (inst.)` enumerate environments are similar, except that we also have to say which counter to use on every level.

```
list enumerate-3 (inst.) 990 \DeclareInstance{list}{enum-1}{std}
list enumerate-4 (inst.) 991 { item-label = \labelenumi , counter = enumi }
992 \DeclareInstance{list}{enum-2}{std}
993 { item-label = \labelenumii , counter = enumii }
994 \DeclareInstance{list}{enum-3}{std}
995 { item-label = \labelenumiii , counter = enumiii }
996 \DeclareInstance{list}{enum-4}{std}
997 { item-label = \labelenumiv , counter = enumiv }
```

`list legacy (inst.)` For the legacy `list` environment there is only one instance which is reused on all levels. This is done this way one because the legacy `list` environment sets all its parameters through its arguments. So this instances shouldn't really be touched. It sets the `legacy-support` key to true, which means that the list code uses `\makelabel` for formatting the label

```
998 \DeclareInstance{list}{legacy}{std} {
999   item-instance = basic ,
1000  legacy-support = true ,
1001 }
```

`list description (inst.)` The `description` lists also use only a single list instance with only one key not using the default:

```
1002 \DeclareInstance{list}{description}{std} { item-instance = description }
```

## 4.10 Item instances

`item basic (inst.)` There two item instances set up: `description` for use with the `description` environment `item description (inst.)` and `basic` for use with all other lists (up to now).

```
1003 \DeclareInstance{item}{basic}{std}
1004 {
1005   label-align = right ,
1006 }
1007 \DeclareInstance{item}{description}{std}
1008 {
1009   label-format = \normalfont\bfseries #1 ,
1010 }
```

## 4.11 Para instances

```
1011 \tag_if_active:T
1012 {
1013   \tagpdfsetup
1014   {
1015     newattribute = {justify}  {/0 /Layout /TextAlign/Justify},
1016     newattribute = {center}   {/0 /Layout /TextAlign/Center},
1017     newattribute = {raggedright}{/0 /Layout /TextAlign/Start},
1018     newattribute = {raggedleft} {/0 /Layout /TextAlign/End},
1019   }
1020 }
```

`para center (inst.)`

```

1021 \DeclareInstance{para}{center}{std}
1022 {
1023   indent-width      = 0pt ,
1024   start-skip       = 0pt ,
1025   left-skip        = \z@flushglue ,
1026   right-skip       = \z@flushglue ,
1027   end-skip         = \z@skip ,
1028   final-hyphen-demerits = 0 ,
1029   cr-cmd           = \@centercr ,
1030   para-class       = center ,
1031 }
1032 \DeclareInstance{para}{raggedright}{std}
1033 {
1034   indent-width      = 0pt ,
1035   start-skip       = 0pt ,
1036   left-skip        = \z@skip ,
1037   right-skip       = \z@flushglue ,
1038   end-skip         = \z@skip ,
1039   final-hyphen-demerits = 0 ,
1040   cr-cmd           = \@centercr ,
1041   para-class       = raggedright ,
1042 }
1043 \DeclareInstance{para}{raggedleft}{std}
1044 {
1045   indent-width      = 0pt ,
1046   start-skip       = 0pt ,
1047   left-skip        = \z@flushglue ,
1048   right-skip       = \z@skip ,
1049   end-skip         = \z@skip ,
1050   final-hyphen-demerits = 0 ,
1051   cr-cmd           = \@centercr ,
1052   para-class       = raggedleft ,
1053 }
1054 \DeclareInstance{para}{justify}{std}
1055 {
1056 %  indent-width      = 0pt ,
1057   start-skip       = 0pt ,
1058   left-skip        = \z@skip ,
1059   right-skip       = \z@skip ,
1060   end-skip         = \z@flushglue ,
1061   final-hyphen-demerits = 5000 ,
1062   cr-cmd           = \@normalcr ,
1063   para-class       = justify ,
1064 }
1065 \ DeclareRobustCommand{\centering } {\UseInstance{para}{center}{}}
1066 \ DeclareRobustCommand{\raggedleft } {\UseInstance{para}{raggedleft}{}}
1067 \ DeclareRobustCommand{\raggedright}{\UseInstance{para}{raggedright}{}}
1068 \ DeclareRobustCommand{\justifying}{\UseInstance{para}{justify}{}}
1069
1070 \justifying

```

## 4.12 Tagging support

In this section we provide code to the various kernel hooks to support the tagging of the different displayblock environments.

All of the following definitions should only be made if tagging is active!

```
1071 \tag_if_active:T {
```

- \\_\\_block\\_beginpar\\_vmode: When a block starts out in vertical mode, i.e., is not yet part of a paragraph, we have to start a paragraph structure. However, this is not the case if we are already flattening paragraphs, thus in this case we do nothing. We also do nothing if @endpe is currently true, because that means we are right now just after the end of a `blockenv` and in the process of looking if we have to end the current `text-unit`, i.e., it is already open.

```
1072   \cs_set:Npn \_\_block_beginpar_vmode: {
1073     \_\_block_debug_typeout:n
1074     { @endpe = \legacy_if:nTF { @endpe }{true}{false}
1075       \on@line }
1076     \legacy_if:nTF { @endpe }
1077     {
1078       \legacy_if_gset_false:n { @endpe }
1079     }
```

We test for <2 because the first flattened environment has to surround itself with a `text-unit`. Only any inner ones then have to avoid adding another `text-unit`.

```
1080   {
1081 %   \typeout{-->G1~ (\int_use:N \l__block_flattened_level_int)}
1082   \int_compare:nNnT \l__block_flattened_level_int < 2
1083   {
1084     \int_gincr:N \g__tag_para_main_begin_int
1085     \tagstructbegin{tag=\l__tag_para_main_tag_t1}
1086   }
1087 }
1088 }
```

*(End definition for \\_\\_block\\_beginpar\\_vmode:.)*

- \\_\\_block\\_beginpar\\_hmode: If the block is already part of a part of a paragraph, i.e., when it has some text directly in front, then the first thing to do is to return to vertical mode. However, that should be done without inserting a paragraph end tag, so before calling `\par` to do its normal work, we disable paragraph tagging and restarting afterwards again. The argument to this config point simply gobbles the `\par` following it in the code above (which is used when there is no tagging going on).

```
1089 \cs_set:Npn \_\_block_beginpar_hmode:N #1
1090   {
1091     \tag_mc_end:
1092     \int_gincr:N \g__tag_para_end_int
1093     \_\_block_debug_typeout:n{increment~ /P \on@line }
1094     \bool_if:NT \l__tag_para_show_bool
1095     { \tag_mc_begin:n{artifact}
1096       \rlap{\color_select:n{red}\tiny\ \int_use:N\g__tag_para_end_int}
1097       \tag_mc_end:
1098     }
1099     \tag_struct_end:
1100     \tagpdfparaOff \par \tagpdfparaOn
1101   }
```

(End definition for `\_block_beginpar_hmode:N`.)

`\_kernel_displayblock_doendpe:` If a display block ends and is followed by a blank line we have to end the enclosing paragraph tagging structure.

```
1102 \cs_set:Npn \_kernel_displayblock_doendpe: {
1103     \bool_if:NT \l__tag_para_bool
1104     {
```

Given that restoring `\par` through the legacy L<sup>A</sup>T<sub>E</sub>X 2<sub><</sub> method can take a few iterations (for example, in case of nested lists, e.g.,  $\dots \end{itemize} \item \dots \par$ ) it can happen that `\_kernel_displayblock_doendpe:` is called while `@endpe` is already handled and then we should not attempt to close a `text-unit` structure. So we need to check for this.

```
1105     \legacy_if:nT { @endpe }
1106     {
```

If the display block currently ending was “flattened” (i.e., uses simplified paragraphs that are not tagged by a combination of `text-unit` followed by `<text>`, but simply with a `<text>`), then we don’t have to do anything, because the `<text>` is already closed.

```
1107     \_block_debug_typeout:n
1108     { flattened= \bool_if:NTF
1109         \l__tag_para_flattened_bool {true}{false}
1110         \on@line }
1111     \bool_if:NTF \l__tag_para_flattened_bool
1112     {
1113         \_block_debug_typeout:n{Structure-end-
1114             \l__tag_para_main_tag_t1\space after~ list \on@line }
1115             \int_gincr:N \g__tag_para_main_end_int
1116             \tag_struct_end: %text-unit
1117     }
1118 }
1119 }
1120 }
```

(End definition for `\_kernel_displayblock_doendpe:..`)

`para/begin` Paragraph tagging is mainly done using the paragraph hooks (will get moved eventually). The default hook setting is not good enough when lists get supported: we need to delay starting the paragraph tagging if we still have to place the list label. We therefore remove the existing hook data and replace it with an augmented version (this will get combined eventually).

```
1121 \RemoveFromHook{para/begin}[tagpdf]
1122 \AddToHook{para/begin}[tagpdf]{
1123     \bool_if:NT \l__tag_para_bool {
```

if we are still waiting to typeset the list label we do nothing (the paragraph tagging then happens when the list is finally typeset).

```
1124     \legacy_if:nF { @inlabel }
1125     {
```

Otherwise, we start a `<text>` tag structure but only if we are not starting a paragraph immediately *after* a list, in which case we only start a new MC (because the `<text>` tag is still open from before the list — one of the reasons why lists are always put “inside” paragraphs).

```

1126     \_\_block_debug_typeout:n
1127     { @endpe = \legacy_if:nTF { @endpe }{true}{false}
1128       \on@line }
1129 \legacy_if:nF { @endpe }
1130   {
1131     \bool_if:N \l__tag_para_flattened_bool

## 5 Documentation from first prototype implementations

### 5.1 Open questions

- Existing questions — moved to issues —

### 5.2 Code cleanup

- Actually implement what's announced.
- Encapsulate most uses of `\legacy_if...` into commands with `expl3` syntax: we cannot rename these booleans for compatibility reasons but we can make the code cleaner nevertheless. — made issue —
- The `\topsep` and `\partopsep` business is tricky to reproduce exactly (see `\@topsepadd` and `\@topsep`) because of how it accumulates when lists are nested immediately.

### 5.3 Tasks

- Change author to LaTeX Team once it's nice enough to deserve that label.
- Reproducing exactly the standard layouts and examples in the `enumitem` documentation.
- Hooks, but do not duplicate those that already exist as environment hooks. Hence, mostly around items.
- Customization and interaction with LDB:
  - Allow arbitrary nesting depth with automatically defined styles for labels, counters etc.
  - Adapt everything to font size! (e.g. footnotes).
  - How to model the inheritance from trivlist to list to enumerate?
- Add key-value settings mimicking `enumitem`'s ability to set any four of five horizontal parameters and deduce the fifth by `\leftmargin + \itemindent = \labelindent + \labelwidth + \labelsep`.
- Provide good ways to customize how overlong labels are dealt with.
- Use the `.aux` file.
  - Implement the `\ref` styles that `enumitem` provides.
  - Reverse enumerations, important in publication lists and the like. Somehow avoid needing 3 compilations for references to reverse enumerations to settle?
  - Ability to calculate `\labelwidth` from the label contents. Share calculated parameters between multiple environments (cf. `resume` option).
- Related to grabbing the whole list environment, and input syntax variations:

- Other layouts: tabular (see `listliketab` vs `typed-checklist`), multicolumn and horizontally numbered (see `tasks`), inline lists, runin lists in the easy case where there is no intervening `\par`.
- Formatting the item text in a box or similar (requires grabbing the whole list).
- Filtering which items to show: hide certain items according to criteria (useful together with list reuse), see `typed-checklist`.
- Shorthands `\iitem` for automatic nested lists, or `\1`, `\2` etc from `outlines`.
- Support markdown input like `asciilist`.
- Check interaction with `babel` options such as `french` or `accadian` (see `FrenchItemizeSpacing`)
- RTL and vertical typesetting.

## 6 Plan of attack of first prototype

Typesetting list environments involves a rather large number of parameters. They can be affected by the context such as the total list nesting level, the nesting level of the given type of list, and the font size. An environment like `enumerate` has two main aspects.

- It has a certain layout in the page, with vertical and horizontal spacing around it. This type of layout is shared with environments such as `quote`, `flushright`, or `tabbing`. This common layout is implemented in  $\text{\LaTeX} 2\epsilon$  through `\trivlist` (or `\list`).
- It defines how each `\item` should be typeset: how to construct the label, in particular the `counter` name, and how to format the content of the item.

This suggests defining two object types, *block* and *item* covering these two aspects.<sup>1</sup> While the *item* type will perhaps have a single template, one could typeset a *block* object in several ways, for instance the standard  $\text{\LaTeX} 2\epsilon$  way or a fancy colored box.

The *general block* template should receive the following parameters. The *plain block* template is a restricted template that freezes all item-related parameters to dummy values (`counter`, `start`, `resume`, `label-width`, `label-sep` and all `item-*`). The *list block* template is a restricted template<sup>2</sup> that omits the `heading` parameter and whose default for `item-instance` is non-empty.

- Structural parameters: the `heading` to place before, `counter` name, `start` value, whether to `resume` a previous list, and the `item-instance` (an *item* instance) to use when typesetting items.
- Vertical spacing and penalties: `beginpenalty`, `beginsep`, `begin-par-skip`, `item-penalty`, `item-skip`, `item-par-skip`, `endpenalty`, `end-skip`, `end-par-skip`.
- Horizontal spacing: `rightmargin`, `leftmargin`, `parindent`, `item-indent`, `label-width`, `label-sep`.

A document class should edit these templates (or define restricted templates) to set

---

<sup>1</sup>Possibly also *endblock* to deal with decorations at the end?

<sup>2</sup>A better approach could be to have a notion of inheritance for object types, so that we end up with two different *object types*. Then we can implement other template for the list object type: *table* for lists typeset as rows/columns of a table, *inline* for lists typeset in horizontal mode within a paragraph, and *runin* for run-in lists.

up default values that depend on `\g_block_nesting_depth_int`, namely how many lists are nested overall.<sup>3</sup> The document class should then set up an instance of these templates for each environment, with appropriate settings such as a `heading`, a suitable `item-instance`, or making `margin-right` equal to `margin-left` in a `quote` environment.

The *inline-list block* template receives many fewer parameters. Note that `beginsep`, `item-skip`, `end-skip` are now *horizontal* skips.

- Structural parameters: `counter`, `start`, `resume`, `item-instance`.
- Spacing and penalties: `beginpenalty`, `beginsep`, `item-penalty`, `item-skip`, `endpenalty`, `end-skip`.
- Horizontal spacing: `label-width`, `label-sep`.

The *std item* template should receive the following parameters. They depend on the type of list and its nesting level among lists of such type, but typically not on the total nesting level.

- Counter name (`counter`), shared with the parent *list block* template, but needed for incrementing.
- Label construction: a function `counter-label` that produces the label from the counter name, used if `\item` is given without argument.
- References: a function `counter-ref` for how the label should be referred to when it is constructed from the counter, `label-ref` and `label-autoref` used when `\item` has an optional argument.
- Label formatting: `label-format` function, `label-strut` boolean.
- Label alignment (`label-align`, `label-boxed`, `next-line`).
- Content parameters: `text-font`.
- A `compatibility` boolean that controls for instance whether `\makelabel` is used.

document class  
customizations

The document class should set up an instance such as `enumiii` for each environment and nesting level.<sup>4</sup>

A given environment will adjust some nesting levels, then call the *block* instance appropriate to the environment type, passing it the *item* instance appropriate to the environment and depth. Additional context-dependence could be provided by `l3ldb`, but the main context-dependence should not rely on it for simplicity reasons and incidentally because `l3ldb` is not yet available.

---

<sup>3</sup>Does `xtemplate` provide a way to specify default values that are only evaluated once an instance is used?

<sup>4</sup>This should be made easily extendible to deeper levels.
